What kind of survey template would be most helpful in building a new survey for your needs? 27

What kind of survey template would be most helpful in building a new survey...

sometimes while learning from specific resources, I feel like it become a stardard way for the instructors to promote certain platfroms and basically advertise their own framework. If it was sponsorships I get, it but sometimes the instructors are insisting on old methods or tools.

Some of terminologies used in the courses such as OS or architecture are out dated. They contain old terminologies such as Master, Slave, etc. In addition some of the analogies used in computer concept are often exclusive to Europe or North America making it harder for others to grasp. These include concepts such as round robin.

I think we have biased content in the slides or examples instructors share with students, such as using gendered terms like he or she, or giving examples that are not inclusive for all genders

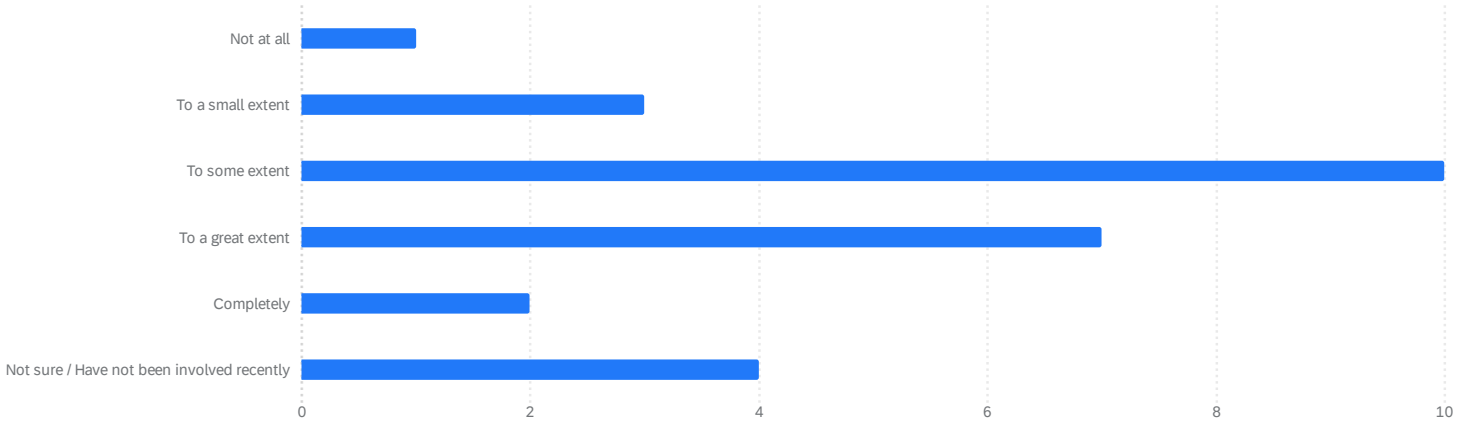
For Studing

In security and privacy classes, the focus is security and very often privacy is excluded.

What kind of survey template would be most helpful in building a new survey...

Some examples in course materials and discussions tend to assume that software engineers, or engineers in general, are men. This reinforces gender stereotypes and can feel exclusionary to women and other underrepresented groups in the field. In addition, there is often an industry bias where case studies focus primarily on big tech companies in North America, overlooking diverse global perspectives and contexts.

To what extent have you observed improvements in the inclusivity of the Software Engineering program or a related field over time (e.g., curriculum, teaching materials, classroom environment)? 27



To what extent have you observed improvements in the inclusivity of the Software Engineering program or a related field over time (e.g., curriculum, teaching materials, classroom environment)? 27

- To what extent have you observed improvements in the inclusivity of the Software Engineering program or a related field over time (e.g., curriculum, teaching materials, classroom environment)?	Count	Count
Not at all	4%	1
To a small extent	11%	3
To some extent	37%	10
To a great extent	26%	7
Completely	7%	2
Not sure / Have not been involved recently	15%	4

If you have observed improvements in inclusivity, please provide specific examples or describe the changes you noticed. 27

If you observed any improvements in inclusivity, please share specific exam...

In the work office there are alot of applications and websites which make our life easy

There are many free resources that are gathered and organazied by Software developer's comunities recently. opentraining.org is a good example.

I have noticed some improvements, especially in first year courses. Professors often try to come up with more broad examples or have moved on to new terminologies such as “main” instead of master.

Coding faster by using AI . So we can write more cohesive code much faster than before I consider this as an improvement.

More recent course materials are adopting gender-neutral pronouns, using diverse names, and including broader context examples beyond stereotypical male interests. Some professors explicitly discuss inclusivity when introducing group work or case studies.

I have noticed that the gender gap with students enrolled in Engineering has been shrinking, most likely due to Canada's 30 by 30 initiative.

I think the software engineering books might get better in terms of biased content

If you observed any improvements in inclusivity, please share specific exam...

I have seen that there is more emphasis on accessibility of material and resources and accommodating to different needs/disabilities in general. In case of gender inclusivity, I noticed that there are more assistance available for females in STEM field.

Many platforms like YouTube and LinkedIn provide a lot of educational materials that pave the way to learn new skills
